[0009] Ordinary oxygen does not react well with most molecules, but it can be "activated" by the addition of energy (naturally or artificially derived; electrical, thermal, photochemical or nuclear), and transformed into reactive oxygen species (ROS). Transformation of oxygen into a reactive state from the addition of a single electron is called reduction (Eqn. 1). The donor molecule that gave up the electron is oxidized. The result of this monovalent reduction of triplet oxygen is superoxide, O<sub>2</sub> • · . It is both a radical ( • , dot sign) and an anion (charge of -1). Other reactive oxygen species known to be created with NTP, are noted below: (On the Ionization of Air for Removal of Noxious Effluvia [Air Ionization of Indoor Environments for Control of Volatile and Particulate Contaminants with Nonthermal Plasmas Generated by Dielectric-Barrier Discharge] Dr. Stacy L. Daniels, IEEE Transactions on Plasma Science, Vol. 30, No. 4, August 2002):

$$O_2 + e \rightarrow O_2 \bullet$$
 (Eqn 1)

$$2 O_2 \cdot \div + 2H + \rightarrow H_2 O_2 + O_2 \bullet$$
 (Eqn 2)

$$O_2$$
·  $^{-}$  +  $H_2O_2$   $\rightarrow$   $O_2$  +  $OH$  · +  $OH$  (Eqn 3)

$$O_2$$
 + 2 H<sub>2</sub>O  $\rightarrow$   $O_2$  + H  $O_2$  + OH  $\rightarrow$  (Eqn 4)

$$2 O_2 \cdot + O_2 + H_2 O \rightarrow 2 O_2 + OH \cdot + OH \cdot$$
 (Eqn 5).
